The new Putzmeister M67-5 boom pump pumps 500 m³ of floor slab

Once it is ready for series production, the new M67-5 truck-mounted concrete pump will be the largest truck-mounted concrete pump in Putzmeister's product range. Even after the official presentation, there is still a lot to do before a product is ready for series production. This report aims to shed some light on the matter.

Putzmeister presented the M67-5 in April 2025 at bauma, the world's largest construction machinery trade fair in Munich. The machine was very well received, with many purchase contracts already signed at the trade fair.

However, the work continues after the presentation. long-term tests and functional tests were carried out, the design was optimised for series production, and the software for controlling the distribution boom (intelligent Boom Control iBC) and the support (intelligent Setup Control iSC) was programmed and optimised. In addition, the truck chassis that can be used in the markets where the M67-5 is to be sold are being tested together with the substructure. Of course, the necessary production documents must also be created for new machines. And the machine must be tested in real-life construction site use.

A large concrete slab was recently poured in Tübingen, requiring 500 m³ of concrete to be pumped in a short period of time. This is a typical construction site for large boom pumps. In addition, the construction site was quite confined, so the intelligent Setup Control (iSC) narrow support system could be tested, as access to the industrial area could not be blocked.

Work began at 6 a.m., and the concrete supply was optimal, with several truck mixers usually standing by and able to pour the concrete into the hopper in parallel. With an average delivery rate of 100 m³ per hour, the M67-5 proved that it works.

About the Putzmeister Group

The Putzmeister Group develops and produces machinery of high technological quality in the fields of concrete conveying, truck-mounted concrete pumps, stationary concrete pumps, placing booms and accessories, plant technology, conveying viscous industrial materials through pipes, concrete spraying and transport in tunnels and underground, mortar machines, plastering machines, screed conveying, injection and specialist applications. Market segments include the construction industry, mining and tunneling, large industrial projects, power plants and sewage treatment plants, as well as waste incineration plants, all over the world.

The company is based in Aichtal. With around 4,000 employees, the company generated sales of around 1 billion euros in the 2024 financial year.

Concreting of the floor slab began early in the morning.

The distributor boom's horizontal reach of over 60 m was necessary to reach all areas of the 12 m deep excavation pit.

Thanks to iSC, the machine could be supported on a very narrow base and access to the industrial area remained unobstructed. In order to supply the M 67-5 with a total of 500 m³ of concrete, two truck mixers were often at the pump at the same time.
